

## Computer Graphics

Lecture 5:

Texture mapping

Graphics Lecture 5: Slide 1

## The Problem:

We don't want to represent all this detail with geometry

Graphics Lecture 5: Slide 2

## The Solution: Textures

- The visual appearance of a graphics scene can be greatly enhanced by the use of texture.
- Consider a brick building, using a polygon for every brick require a huge effort in scene design.
- So why not use one polygon and draw a repeating brick pattern (*texture*) onto it?

Graphics Lecture 5: Slide 3

## The Quest for Visual Realism

Graphics Lecture 5: Slide 4

### Texture Definition

- Textures may be defined as:
  - Pixmaps - Arrays containing the actual pixel values to be mapped to the polygon, e.g. photos.
  - Procedures - Suitable for repeating patterns.

Graphics Lecture 5: Slide 5

### Procedural textures

- Write a function:  $F(\mathbf{p}) \rightarrow \text{color}$

- non-intuitive
- difficult to match existing texture

Graphics Lecture 5: Slide 6

### Photo textures

Graphics Lecture 5: Slide 7

### The concept of texture mapping

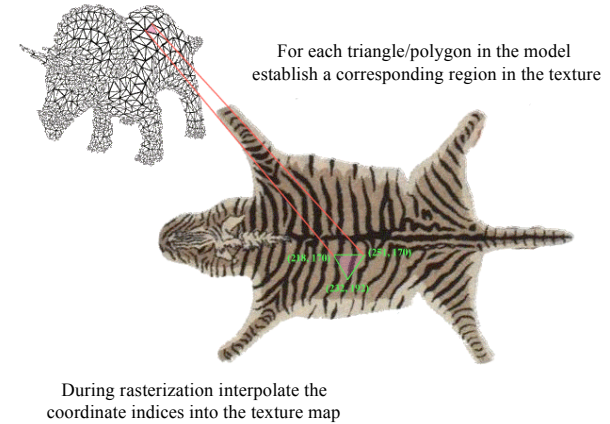

Graphics Lecture 5: Slide 8

### Texture mapping: Terminology

Graphics Lecture 5: Slide 9

### The concept of texture mapping

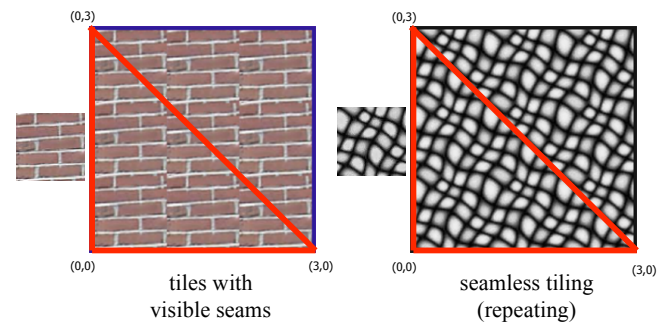

### Texture Coordinates

- Specify a texture coordinate  $(s, t)$  at each vertex
- Canonical texture coordinates  $(0,0) \rightarrow (1,1)$
- Often the texture size is a power of 2 (but it doesn't have to be)
- How can we tile this texture?

Graphics Lecture 5: Slide 11

### Tiling Texture

Graphics Lecture 5: Slide 12

### Texture synthesis

Graphics Lecture 5: Slide 13

### Texture coordinates

- Specify a texture coordinate  $(s, t)$  at each vertex
- Canonical texture coordinates  $(0,0) \rightarrow (1,1)$
- Linearly interpolate the values in screen space

Graphics Lecture 5: Slide 14

### Mapping texture to individual pixels

- Interpolate texture coordinates across scanlines
- Same as Gouraud shading but now for texture coordinates not shading values

Graphics Lect

### What Goes Wrong?

- Notice the distortion along the diagonal triangle edge of the cube face

Graphics Lecture 5: Slide 16

### Perspective projection

- The problem is that perspective projection does not preserve affine combinations of points!
- In particular, equal distances along a line in eye space do not map to equal distances in screen space

- Linear interpolation in screen space is not equal to linear interpolation in eye space!

Graphics Lecture 5: Slide 17

### How to fix?

- Suppose we assign parameter  $t$  to vertices  $\mathbf{p}$  and  $\mathbf{r}$
- Suppose  $t = 0$  at  $\mathbf{p}$ , and  $t = 1$  at  $\mathbf{r}$
- $\mathbf{p}$  projects to  $\mathbf{p}'$  and  $\mathbf{r}$  projects to  $\mathbf{r}'$  (divide by  $w$ )
- What value should  $t$  have at location  $\mathbf{q}'$ ?

### How to fix?

- We cannot linearly interpolate  $t$  between  $\mathbf{r}'$  and  $\mathbf{p}'$
- Only projected values can be linearly interpolated in screen space
- Solution: perspective-correct interpolation

### Perspective Correct Interpolation

- Linearly interpolate  $t/w$  (not  $t$ ) between  $\mathbf{p}'$  and  $\mathbf{r}'$ .
  - Compute  $t_p = t_p / w_p$  and  $t_r = t_r / w_r$
  - Linearly interpolate (lerp)  $t_p$  and  $t_r$  to get  $t_q'$  at location  $\mathbf{q}'$
- But, we want the (unprojected) parameter  $t_q$ , not  $t_q'$

Graphics Lecture 5: Slide 20

### Perspective Correct Interpolation

- The parameter  $t_q$  is related to  $t_q$  by a factor of  $1/w$ :
  - Lerp  $1/w_p$  and  $1/w_r$  to obtain  $1/w_q$  at point  $q$ .
  - Divide  $t_q$  by  $1/w_q$  to get  $t_q$

Graphics Lecture 5: Slide 21

### Perspective Correct Interpolation

- Summary:
  - Given parameter  $t$  at vertices:
    - Compute  $1/w$  for each vertex
    - Linearly interpolate  $1/w$  across the triangle
    - Linearly interpolate  $t/w$  across the triangle
    - Do perspective division:
      - Divide  $t/w$  by  $1/w$  to obtain interpolated parameter  $t$

Graphics Lecture 5: Slide 22

### Perspective Correct Interpolation

Graphics Lecture 5: Slide 23

### Mapping texture to individual pixels

Graphics Lecture 5: Slide 24

### Bi-linear Map - Solving for $\alpha$ and $\beta$

$$\mathbf{p} = \alpha\mathbf{a} + \beta\mathbf{e}$$

$$\mathbf{e} = \mathbf{b} + \alpha(\mathbf{c} - \mathbf{b})$$

SO

$$\mathbf{p} = \alpha\mathbf{a} + \beta\mathbf{b} + \alpha\beta(\mathbf{c} - \mathbf{b})$$

Its Quadratic !

Graphics Lecture 5: Slide 25

### Non Linearities in texture mapping

- The second order term means that straight lines in the texture may become curved when the texture is mapped.
- However, if the mapping is to a parallelogram:
  - $\mathbf{p} = \alpha\mathbf{a} + \beta\mathbf{b} + \alpha\beta(\mathbf{c} - \mathbf{b})$
  - and
  - $\mathbf{b} = \mathbf{c}$
  - so  $\mathbf{p} = \alpha\mathbf{a} + \beta\mathbf{b}$

Graphics Lecture 5: Slide 26

### Texture Mapping & Illumination

- Texture mapping can be used to alter some or all of the constants in the illumination equation

$$L(\omega_r) = k_a + \left( k_d(\mathbf{n} \cdot \mathbf{l}) + k_s(\mathbf{v} \cdot \mathbf{r})^q \right) \frac{\Phi_s}{4\pi d^2}$$

Constant Diffuse Color

Diffuse Texture Color

Texture used as Label

Texture used as Diffuse Color

Graphics Lecture 5: Slide 27

### 2D Texture Mapping

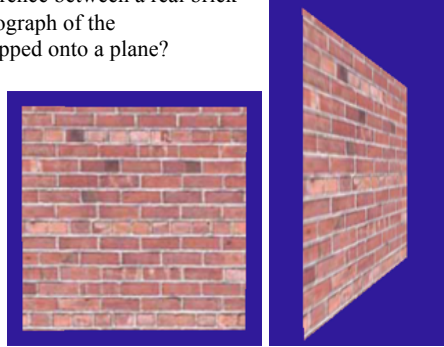

- Increases the apparent complexity of simple geometry
- Requires perspective projection correction
- Can specify variations in shading within a primitive:
  - Illumination
  - Surface
  - Reflectance

Graphics Lecture 5: Slide 28

### What's Missing?

- What's the difference between a real brick wall and a photograph of the wall texture-mapped onto a plane?
- What happens if we change the lighting or the camera position?

Graphics Lecture 5: Slide 29

### Remember Normal Averaging for Shading?

- Instead of using the normal of the triangle, interpolate an averaged normal at each vertex across the face

Gr

### Bump Mapping

- Textures can be used to alter the surface normal of an object.
- This does not change the actual shape of the surface - we are only shading it as if it were a different shape!

Sphere w/Diffuse Texture

Swirly Bump Map

Sphere w/Diffuse Texture & Bump Map

Graphics Lecture 5: Slide 31

### Bump Mapping

- The texture map is treated as a single-valued height function.
- The partial derivatives of the texture tell us how to alter the true surface normal at each point to make the object appear as if it were deformed by the height function.

Graphics Lecture 5: Slide 32

### Another Bump Map Example

Graphics Lecture 5: Slide 33

### What's Missing?

- What does a texture- & bump-mapped brick wall look like as you move the viewpoint?
- What does the silhouette of a bump-mapped sphere look like?

Graphics Lecture 5: Slide 34

### Displacement Mapping

- Use the texture map to actually move the surface point.
  - How is this different than bump mapping?
- The geometry must be displaced before visibility is determined.

Graphics Lecture 5: Slide 35

### Environment Maps

- We can simulate reflections by using the direction of the reflected ray to index a spherical texture map at "infinity".
- Assumes that all reflected rays begin from the same point.

Graphics Lecture 5: Slide 36
