

## *Interactive Computer Graphics*

### Lecture 16: Fire

Graphics Lecture 16: Slide 1

## *Amorphous Objects*

Amorphous objects are still a major challenge in computer graphics.

Fire,  
Smoke  
Water  
Clouds  
&c.

They are the subject of current research - marketable in computer games and films.

Graphics Lecture 16: Slide 2

## *Polygons*

Texture mapping polygons is fast and acceptable for short lived effects.

Overlay an flame point with a series of textured polygons (25 for a one second effect)

Graphics Lecture 16: Slide 3

## *Using polygons and fixing up the lighting*

To make things more realistic we need to introduce secondary light sources at the point of the fire.

Graphics Lecture 16: Slide 4

## *Limitations of Polygons*

Polygon fires are:

- Difficult to sustain for for long periods
- Difficult to spread or change shape
- Difficult to introduce translucency

Though they are fast and therefore good for interactive graphics.

Graphics Lecture 16: Slide 5

## *Modeling Fire*

Modeling fire is computationally expensive, but can produce better effects.

Flames are incandescent gases having temperature pressure and density.

The visual appearance and shape changes (due to diffusion) are functions of these.

Modeling the physics accurately is difficult

Graphics Lecture 16: Slide 6

### Particle Systems

One solution is to approximate flame - and other amorphous objects - by a discrete set of small particles.

Particles can have:

- Mass
- Position
- Velocity
- Temperature
- Shape (not often used)
- Lifetime

Graphics Lecture 16: Slide 7

### Particle Creation

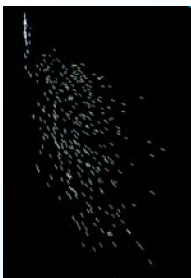

Particles can be created according to a probability distribution.

They can be given an initial velocity and a lifetime

Depending on the simulation their movement can be determined by dynamics.

Graphics Lecture 16: Slide 8

### Example - (water not fire!)

New particles created each frame  
the number created per frame is normally distributed

Each particle has an initial downward velocity  
again normally distributed

Each successive frame each particle is acted on by a "wind" force to the right

Graphics Lecture 16: Slide 9

### Particle Dynamics

Newtonian particles:  $\mathbf{f} = m \mathbf{a}$  (NB  $\mathbf{f}$  and  $\mathbf{a}$  are vectors)

$$\mathbf{a} = d\mathbf{v}/dt = d^2\mathbf{x}/dt^2$$

Given  $\mathbf{f}$  we need to find the change in position  $\mathbf{x}$  so we need to integrate.

But since we are working in frame intervals we can use a simple approximation.

$$\mathbf{v}_{t+1} = \mathbf{a}_t \Delta t + \mathbf{v}_t$$

$$\mathbf{x}_{t+1} = \mathbf{v}_t \Delta t + \mathbf{x}_t$$

Accuracy is not as important as effect!

Graphics Lecture 16: Slide 10

### Practical particle system algorithm

for each video frame

- { generate new particles;
- remove old particles;
- for each particle
  - { resolve forces by vector addition;
  - calculate  $\mathbf{a}$ ,  $\mathbf{v}$ ,  $\mathbf{x}$
  - apply rendering algorithm;
  - }
- }

Graphics Lecture 16: Slide 11

### Enhancements - 1

Introduce damping:

$$\mathbf{f} = m\mathbf{a} + s\mathbf{v}$$

$s$  is a scalar constant called damping or friction

for a gas it relates to the viscosity

An easy enhancement

Graphics Lecture 16: Slide 12

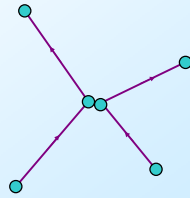

### Enhancements - 2

Allow particles to collide

Problems:  
Sub frame calculation required

Particle shape and size needed

Large number of particle/particle checks needed

Graphics Lecture 16: Slide 13

### Simple Rendering

Project particles to the view frame, then

1. Single point for each particle
2. Blob for each particle
3. Streak for each particle  
(line of motion during the frame)
4. Blend particle projection with the raster  
(translucency)

Graphics Lecture 16: Slide 14

### Rendering

Particle Colour

1. Make colour particle age dependent  
(simple to implement)
2. Make colour temperature dependent  
(requires modeling the temperature)

Graphics Lecture 16: Slide 15

### The wrath of Khan

Strong contender for the worst film of 1982.

First use of a particle system to model fire:

Reeves, (1983) Particle systems - a technique for modelling a class of fuzzy objects. Computer Graphics (SIGGRAPH 1983) 17(3):359-376

(the next few images are from the paper)

Graphics Lecture 16: Slide 16

### The Wrath of Khan - Storyboard

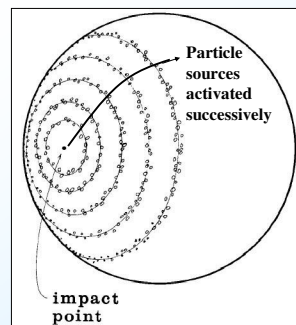

The genesis project

A barren planet is to be brought to life by dropping a bomb on it.

Doesn't sound very likely to me.

Graphics Lecture 16: Slide 17

### The Wrath of Khan - overview

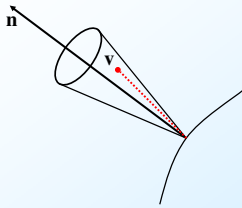

Many particle systems starting at different times to simulate the flames spreading

In total around 750,000 particles

Graphics Lecture 16: Slide 18

### *The Wrath of Khan - Particle Initialisation*

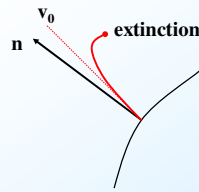

Velocity magnitude distributed normally

Magnitude diminishes with time

Velocity direction distributed about the normal

Graphics Lecture 16: Slide 19

### *The Wrath of Khan - Particle Dynamics*

Gravitational force pulling the particles towards the planet.

Particle lifetime short to prevent a whole parabola being visible

Graphics Lecture 16: Slide 20

### *The Wrath of Khan- Rendering*

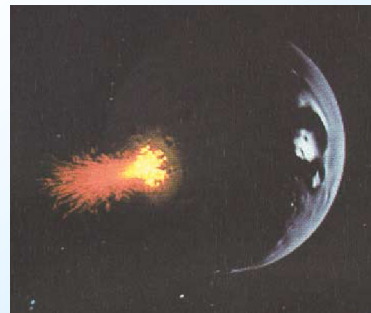

Planet rendered first - fake light source above the particle system to create the light emitted by the flames.

Line segment for each particle projected and drawn over the planet image, motion blur applied

Colour time dependent, yellow to red

Graphics Lecture 16: Slide 21

### *How did it look? Good Explosion!*

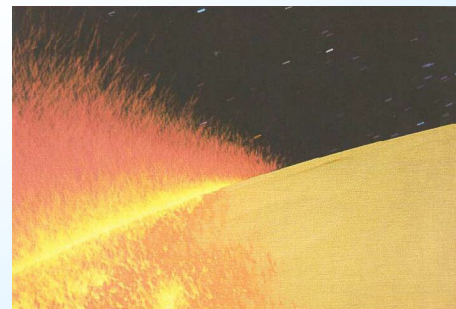

Graphics Lecture 16: Slide 22

### *Effective flame spread*

Graphics Lecture 16: Slide 23

### *Close up it looks like the edge of a carpet!*

Graphics Lecture 16: Slide 24

### *Particles in Real Time - Quake*

1. A pre-rendered bitmap
2. Real time rendered glow
3. Animated glowing particles

Graphics Lecture 16: Slide 25

### *Where Next - Modelling*

Particle systems are very flexible modelling tools capable of simulating a lot of effects.

The particle modelling in the Wrath of Khan was simple and effective, but there might be some benefit in incorporating more features.

Graphics Lecture 16: Slide 26

### *Temperature*

Gases cool as they expand - particles move slower at lower temperature.

Gas expansion is related to pressure differential.

The possibilities are endless and there have been lots of ideas tried.

Graphics Lecture 16: Slide 27

### *Where next - rendering*

The real failure in the Wrath of Khan is the rendering.

Straight line segments are not a visual characteristic of incandescent gases

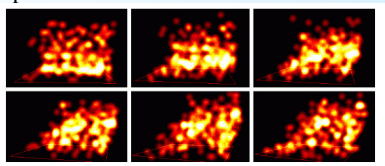

The lines are very much apparent where the particle density is low

Graphics Lecture 16: Slide 28

### *Bitmap Splatting*

Render the particles as splats rather than lines.

Each splat has a pattern with degrees of opacity at each pixel

Laur and Hanrahan 1991

Graphics Lecture 16: Slide 29

### *Ray tracing - Blobs*

Blobs can be thought of as 3D splats

Particles are treated as the centre of blobs and the flame dynamics can be modelled by the particles

Blobs can be warped in 3D to produce a less regular appearance for the fire.

Graphics Lecture 16: Slide 30

### Ray Tracing Blobs is volume rendering

As the ray travels through a blob it adopts a proportion of the blob colour.

It may travel through the whole particle field and take up a proportion of the scene behind

Alternatively it can terminate within the particle field in places where it is denser.

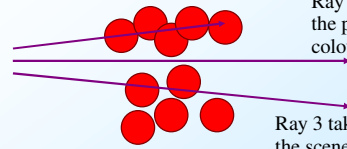

Graphics Lecture 16: Slide 31

### Ray tracing particle fields

Ray 1 takes all its colour from the particle field. The background is occluded

Ray 2 passes unchanged through the particle field and takes its colour from the scene behind

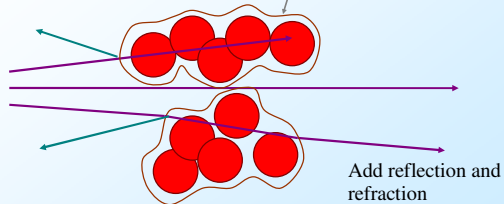

Ray 3 takes part of its colour from the scene behind and part from the particle field

Graphics Lecture 16: Slide 32

### Further possibilities - Implicit Surfaces

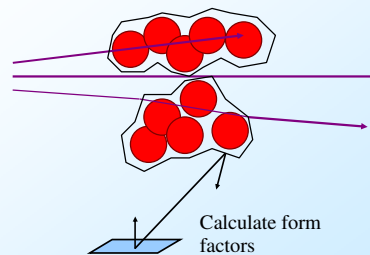

Fit an implicit surface over the particles

Graphics Lecture 16: Slide 33

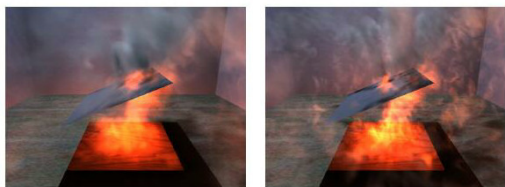

### Further possibilities - Radiosity

Polygonise the implicit surface

Graphics Lecture 16: Slide 34

### Flames with radiosity and blob shadows
