Concurrency

State Models and Java Programs

Jeff Magee and Jeff Kramer
What is a Concurrent Program?

A **sequential** program has a single thread of control.

A **concurrent** program has multiple threads of control allowing it perform multiple computations in parallel and to control multiple external activities which occur at the same time.
Why Concurrent Programming?

- **Performance gain from multiprocessing hardware**
  - parallelism.

- **Increased application throughput**
  - an I/O call need only block one thread.

- **Increased application responsiveness**
  - high priority thread for user requests.

- **More appropriate structure**
  - for programs which interact with the environment, control multiple activities and handle multiple events.
Do I need to know about concurrent programming?

Concurrent programming errors contributed to accidents causing deaths and serious injuries.

♦ Therac - 25 computerised radiation therapy machine

Concurrent programming errors contributed to accidents causing deaths and serious injuries.

♦ Mars Rover

Problems with interaction between concurrent tasks caused periodic software resets reducing availability for exploration.
a Cruise Control System

When the car ignition is switched on and the **on** button is pressed, the current speed is recorded and the system is enabled: it maintains the speed of the car at the recorded setting.

Pressing the brake, accelerator or **off** button disables the system. Pressing **resume** re-enables the system.

♦ **Is the system safe?**

♦ **Would testing be sufficient to discover all errors?**
models

A model is a simplified representation of the real world. Engineers use models to gain confidence in the adequacy and validity of a proposed design.

♦ focus on an aspect of interest - concurrency
♦ model animation to visualise a behaviour
♦ mechanical verification of properties (safety & progress)

Models are described using state machines, known as Labelled Transition Systems LTS. These are described textually as finite state processes (FSP) and displayed and analysed by the LTSA analysis tool.
Later chapters will explain how to construct models such as this so as to perform animation and verification.
programming practice in Java

Java is

♦ widely available, generally accepted and portable
♦ provides sound set of concurrency features

Hence Java is used for all the illustrative examples, the demonstrations and the exercises. Later chapters will explain how to construct Java programs such as the Cruise Control System.

“Toy” problems are also used as they crystallize particular aspects of concurrent programming problems!
course objective

This course is intended to provide a sound understanding of the concepts, models and practice involved in designing concurrent software.

The emphasis on principles and concepts provides a thorough understanding of both the problems and the solution techniques. Modeling provides insight into concurrent behavior and aids reasoning about particular designs. Concurrent programming in Java provides the programming practice and experience.
Course Outline

♦ Processes and Threads
♦ Concurrent Execution
♦ Shared Objects & Interference
♦ Monitors & Condition Synchronization
♦ Deadlock
♦ Safety and Liveness Properties
♦ Model-based Design

Concepts
Models
Practice

♦ Dynamic systems
♦ Concurrent Software Architectures
♦ Message Passing
♦ Timed Systems
Web based course material

CD-ROM and
http://www-dse.doc.ic.ac.uk/concurrency/

- Java examples and demonstration programs
- State models for the examples
- Labelled Transition System Analyser (LTSA) for modeling concurrency, model animation and model property checking.
Summary

◆ Concepts
  • we adopt a model-based approach for the design and construction of concurrent programs

◆ Models
  • we use finite state models to represent concurrent behavior.

◆ Practice
  • we use Java for constructing concurrent programs.

Examples are used to illustrate the concepts, models and demonstration programs.
