 $S = \{s_1, \ldots, s_n\}$

e.g., the squares in the Wumpus World.

• States can also take into account the inner state of the agent, e.g., the knowledge base *KB*;

The universe in which the agent moves is a finite set of states

 $S = \{s_1, \ldots, s_n\}$

e.g., the squares in the Wumpus World.

- States can also take into account the inner state of the agent, e.g., the knowledge base *KB*;
- or the actions they have performed, e.g., climbing out of the cave with the gold.

Utility functions

A utility function is a function

 $u:S \to \mathbb{R}$

associating a real number to each state.

(ロ) (部) (E) (E)

Utility functions

A utility function is a function

 $u:S\to\mathbb{R}$

associating a real number to each state.

Important:

Utility functions are not the same as money. Utility functions are a representation of happiness, goal satisfaction, fulfilment and the like. They are just a mathematical tool to represent a comparison between outcomes. So altruism, unselfishness, and so fort **can** be modelled using utility functions.

Utility functions

A utility function is a function

 $u:S\to\mathbb{R}$

associating a real number to each state.

Important:

Utility functions are not the same as money. Utility functions are a representation of happiness, goal satisfaction, fulfilment and the like. They are just a mathematical tool to represent a comparison between outcomes. So altruism, unselfishness, and so fort **can** be modelled using utility functions. (Paolo Turrini 2016)

Lotteries

A lottery is a probability distribution over the set of states.

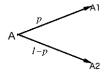

- 4 回 2 - 4 回 2 - 4 回 2 - 4

æ

Lotteries

A lottery is a probability distribution over the set of states. e.g., for outcomes A_1 and A_2 , and $p \in [0, 1]$

Lottery $A = [p, A_1; (1 - p), A_2]$

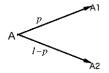

< 同 > < 臣 > < 臣 >

Lotteries

A lottery is a probability distribution over the set of states. e.g., for outcomes A_1 and A_2 , and $p \in [0, 1]$

Lottery $A = [p, A_1; (1 - p), A_2]$

L is the set of lotteries over *S*.

Simple Lotteries

Observation: A state $s \in S$ can be seen as a lottery

・ロト ・回ト ・ヨト

⊸ ≣ ≯

Simple Lotteries

Observation: A state $s \in S$ can be seen as a lottery: where s is assigned probability 1 and all other states probability 0.

Simple Lotteries

Observation: A state $s \in S$ can be seen as a lottery: where s is assigned probability 1 and all other states probability 0.

e.g., $A = [1, A_1; 0, A_2; 0, A_3; \ldots]$

We get A_1 with probability 1, and the rest with probability 0.

Michael Maschler, Eilon Solan and Shmiel Zamir Game Theory (Ch. 2) Cambridge University Press, 2013.

< 🗇 > < 🖃 >

Michael Maschler, Eilon Solan and Shmiel Zamir Game Theory (Ch. 2) Cambridge University Press, 2013.

The main message

Give me any order on outcomes that makes sense and I can turn it into a utility function!

• Certain outcomes seem difficult to compare:

< □ > < □

< ∃⇒

- Certain outcomes seem difficult to compare:
 - what factors are more important?

< 17 <

- Certain outcomes seem difficult to compare:
 - what factors are more important?
 - have we considered all the relevant ones?

- Certain outcomes seem difficult to compare:
 - what factors are more important?
 - have we considered all the relevant ones?
 - do factor interfere with one another?

- Certain outcomes seem difficult to compare:
 - what factors are more important?
 - have we considered all the relevant ones?
 - do factor interfere with one another?
- In other situations the utility function may be updated because of new incoming information (e.g., evaluating non-terminal positions in a long extensive game like Chess or Go)

Figure: Deep Blue- Kasparov 1996, Final Game. Material favours Black but the position is hopeless

How can we handle utility functions of many variables $X_1 \dots X_n$?

- 4 回 ト - 4 回 ト - 4 回 ト

How can we handle utility functions of many variables $X_1 \dots X_n$? e.g., what is U(king safety, material advantage, control of the centre)?

How can we handle utility functions of many variables $X_1 \dots X_n$? e.g., what is

U(king safety, material advantage, control of the centre)?

• We need to find ways to compare bundles of factors, but might be difficult in general (strict dominance, stochastic dominance).

How can we handle utility functions of many variables $X_1 \dots X_n$? e.g., what is

U(king safety, material advantage, control of the centre)?

- We need to find ways to compare bundles of factors, but might be difficult in general (strict dominance, stochastic dominance).
- Search methods to avoid multicriteria altogether: Monte Carlo Tree Search generates random endgames.

How can we handle utility functions of many variables $X_1 \dots X_n$? e.g., what is

U(king safety, material advantage, control of the centre)?

- We need to find ways to compare bundles of factors, but might be difficult in general (strict dominance, stochastic dominance).
- Search methods to avoid multicriteria altogether: Monte Carlo Tree Search generates random endgames.

We assume there is a way of assigning a utility function to bundles of factors and therefore compare them.

Rewards:

• -1000 for dying

• 0 any other square

What's the expected utility of going to [3,1], [2,2], [1,3]?

Using conditional independence contd.

 $\begin{aligned} \mathsf{P}(P_{1,3}|\textit{known}, b) &= \alpha' \left< 0.2(0.04 + 0.16 + 0.16), \ 0.8(0.04 + 0.16) \right> \\ &\approx \left< 0.31, 0.69 \right> \end{aligned}$

 $\mathsf{P}(P_{2,2}|known, b) \approx \langle 0.86, 0.14 \rangle$

A A

The expected utility u(1,3) of the action (1,3) of going to [1,3] from an explored adjacent square is:

u(1,3) =

The expected utility u(1,3) of the action (1,3) of going to [1,3] from an explored adjacent square is:

u(1,3) = u[0.31, -1000; 0.69, 0]

The expected utility u(1,3) of the action (1,3) of going to [1,3] from an explored adjacent square is:

u(1,3) = u[0.31, -1000; 0.69, 0] = -310

▲冊 ▶ ▲ 臣 ▶ .

The expected utility u(1,3) of the action (1,3) of going to [1,3] from an explored adjacent square is:

u(1,3) = u[0.31, -1000; 0.69, 0] = -310

u(3,1) = u(1,3)

< □ > < □ > < □ >

The expected utility u(1,3) of the action (1,3) of going to [1,3] from an explored adjacent square is:

u(1,3) = u[0.31, -1000; 0.69, 0] = -310u(3,1) = u(1,3)u(2,2) =

▲圖 ▶ ▲ 臣 ▶ ▲ 臣 ▶

The expected utility u(1,3) of the action (1,3) of going to [1,3] from an explored adjacent square is:

u(1,3) = u[0.31, -1000; 0.69, 0] = -310u(3,1) = u(1,3)u(2,2) = u[0.86, -1000; 0.14, 0]

▲圖 ▶ ▲ 臣 ▶ ▲ 臣 ▶ …

The expected utility u(1,3) of the action (1,3) of going to [1,3] from an explored adjacent square is:

u(1,3) = u[0.31, -1000; 0.69, 0] = -310u(3,1) = u(1,3)u(2,2) = u[0.86, -1000; 0.14, 0] = -860

▲圖 ▶ ▲ 国 ▶ ▲ 国 ▶

The expected utility u(1,3) of the action (1,3) of going to [1,3] from an explored adjacent square is:

u(1,3) = u[0.31, -1000; 0.69, 0] = -310u(3,1) = u(1,3)u(2,2) = u[0.86, -1000; 0.14, 0] = -860

Clearly going to [2,2] from either [1,2] or [2,1] is irrational.

The expected utility u(1,3) of the action (1,3) of going to [1,3] from an explored adjacent square is:

```
u(1,3) = u[0.31, -1000; 0.69, 0] = -310
u(3,1) = u(1,3)
u(2,2) = u[0.86, -1000; 0.14, 0] = -860
```

Clearly going to [2,2] from either [1,2] or [2,1] is irrational. Either going to [1,3] or [3,1] is the rational choice.

 $\begin{array}{l} u(2,2) = \\ 0.8 \times u[0.86, -1000; 0.14, 0] + 0.1 \times u[0.31, -1000; 0.69, 0] + \\ + 0.1 \times u[1, 0] = 0.8 \times -860 + 0.1 \times -310 = -688 - 31 \end{array}$

 $\begin{array}{l} u(2,2) = \\ 0.8 \times u[0.86, -1000; 0.14, 0] + 0.1 \times u[0.31, -1000; 0.69, 0] + \\ + 0.1 \times u[1, 0] = 0.8 \times -860 + 0.1 \times -310 = -688 - 31 = -729 \end{array}$

$$\begin{array}{l} u(2,2) = \\ 0.8 \times u[0.86, -1000; 0.14, 0] + 0.1 \times u[0.31, -1000; 0.69, 0] + \\ + 0.1 \times u[1,0] = 0.8 \times -860 + 0.1 \times -310 = -688 - 31 = -729 \end{array}$$

u(1,3) = u(3,1) (because of symmetry)

$$\begin{array}{l} u(2,2) = \\ 0.8 \times u[0.86, -1000; 0.14, 0] + 0.1 \times u[0.31, -1000; 0.69, 0] + \\ + 0.1 \times u[1,0] = 0.8 \times -860 + 0.1 \times -310 = -688 - 31 = -729 \end{array}$$

u(1,3) = u(3,1) (because of symmetry)

Going to [2,2] is still the irrational choice, but not as bad. The rational choice is either going to [1,3] or [3,1].

$$\begin{array}{l} u(2,2) = \\ 0.8 \times u[0.86, -1000; 0.14, 0] + 0.1 \times u[0.31, -1000; 0.69, 0] + \\ + 0.1 \times u[1, 0] = 0.8 \times -860 + 0.1 \times -310 = -688 - 31 = -729 \end{array}$$

u(1,3) = u(3,1) (because of symmetry)

Going to [2,2] is still the irrational choice, but not as bad. The rational choice is either going to [1,3] or [3,1].

Obviously, the more chaotic the decision system the less the impact of reward difference.

A (1) > A (2) > A

Summary

- Utility, lotteries and preferences
- Maximisation of expected utility
- Stochastic actions
