æ

### What you have seen

You have seen procedures for computational problem-solving:

- searching
- learning
- planning

< A > < 3

#### An agent, a mathematical entity acting in a simple world

- 4 回 ト - 4 回 ト - 4 回 ト

An agent, a mathematical entity acting in a simple world

- Able to reason about the world around
  - true facts (knowledge)
  - plausible facts (beliefs)

A (1) > (1) > (1)

An agent, a mathematical entity acting in a simple world

- Able to reason about the world around
  - true facts (knowledge)
  - plausible facts (beliefs)
- Able to take decisions under uncertainty
  - Imperfect and incomplete information
  - Quantifying uncertainty, attaching probabilities
  - Going for uncertain outcomes, calculating expected utility

An agent, a mathematical entity acting in a simple world

- Able to reason about the world around
  - true facts (knowledge)
  - plausible facts (beliefs)
- Able to take decisions under uncertainty
  - Imperfect and incomplete information
  - Quantifying uncertainty, attaching probabilities
  - Going for uncertain outcomes, calculating expected utility
- Able to update his (or her) beliefs when confronted with new information (learning)

### What is rationality?

Robert J. Aumann Nobel Prize Winner Economics "A person's behavior is rational if it is in his best interests, given his information"

### What is rationality?

Robert J. Aumann Nobel Prize Winner Economics "A person's behavior is rational if it is in his best interests, given his information"

Agents (not only humans) can be rational!

### The lectures one by one

- Logical Agents I
- Logical Agents II
- An Uncertain World
- Making Sense of Uncertainty
- Making (Good) Decisions
- Making Good Decisions in time
- Learning from Experience I
- Learning from Experience II

# Logical Agents I

-

### The Wumpus World

イロト イヨト イヨト イヨト

æ

### Agents

Sensors Breeze, Glitter, Smell Actuators Turn L/R, Go, Grab, Release, Shoot, Climb Rewards 1000 escaping with gold, -1000 dying, -10 using arrow, -1 walking

#### Environment • Squares adjacent to Wumpus are smelly

- Squares adjacent to pit are breezy
- Glitter iff gold is in the same square
- Shooting kills Wumpus if you are facing it
- Shooting uses up the only arrow
- Grabbing picks up gold if in same square
- Releasing drops the gold in same square

A (1) > A (1) > A

### Knowledge base

- A set of sentences representing what the agent thinks about the world.
  - "I am in [2,1]"
  - "I am out of arrows"
  - "I smell Wumpus"
  - "I'd better not go forward"
- We interpret it as what the agent *knows*, but it can very well work for what the agent *believes*.

### Updating the knowledge base

- What we TELL the knowledge base
- What we ASK the knowledge base

function KB-AGENT(percept) returns an action static: KB, a knowledge base t, a counter, initially 0, indicating time TELL(KB, MAKE-PERCEPT-SENTENCE(percept, t)) action  $\leftarrow$  ASK(KB, MAKE-ACTION-QUERY(t)) TELL(KB, MAKE-ACTION-SENTENCE(action, t))  $t \leftarrow t + 1$ return action

A (10) > (10)

• The starting state...

"A square is breezy if and only if there is an adjacent pit"

### Expressivity: at what cost?

- OK if we were only dealing with finite objects
- But even then we would have to enumerate all the possibilities;

### Expressivity: at what cost?

- OK if we were only dealing with finite objects
- But even then we would have to enumerate all the possibilities;

Propositional Logic lacks expressive power

### First order logic

- Massive increase of expressivity
- But there are costs, e.g., decidability
- We will see how to exploit the gains while limiting the costs

## FOL KB

• We can encode the KB at each particular time point using FOL function KB-AGENT(percept) returns an action static: KB, a knowledge base t, a counter, initially 0, indicating time TELL(KB, MAKE-PERCEPT-SENTENCE(percept, t)) action  $\leftarrow$  ASK(KB, MAKE-ACTION-QUERY(t)) TELL(KB, MAKE-ACTION-SENTENCE(action, t)) t  $\leftarrow$  t + 1 return action

Knows(Joffrey, x)	Knows(x, Sansa)	

・ロン ・部と ・ヨン ・ヨン

### UNIFY $(\alpha, \beta)$ returns $\theta$ if $\alpha \theta = \beta \theta$

р	q	$\theta$
Knows(Joffrey, x)	Knows(Joffrey, Sansa)	$\{x/Sansa\}$
Knows(Joffrey,x)	Knows(y, Sansa)	{ <i>x</i> / <i>Sansa</i> , <i>y</i> / <i>Joffrey</i> }
Knows(Joffrey, x)	Knows(y, Mother(Joffrey))	{y/Joffrey, x/Mother(Joffrey)}
Knows(Joffrey, x)	Knows(x, Sansa)	fail

・ロン ・部と ・ヨン ・ヨン

### Standardising apart

### Knows(Joffrey, x) & Knows(x, Sansa) fails

▲圖▶ ▲屋▶ ▲屋▶

### Standardising apart

### Knows(Joffrey, x) & Knows(x, Sansa) fails

Standardising apart eliminates overlap of variables, e.g.,  $Knows(z_{17}, Sansa)$ 

Definite clause:

disjunction of literals, exactly one of which positive

<**-**→ **-**→ **-**→

#### Definite clause:

disjunction of literals, exactly one of which positive

e.g.,  $(p_1 \land p_2 \land \ldots \land p_n \Rightarrow q)$

Assuming all variables are universally quantified...

 $\begin{array}{ll} p_1' \text{ is } \textit{King}(\textit{Joffrey}) & p_1 \text{ is } \textit{King}(x) \\ p_2' \text{ is } \textit{Greedy}(y) & p_2 \text{ is } \textit{Greedy}(x) \\ \theta \text{ is } \{x/\textit{Joffrey}, y/\textit{Joffrey}\} & q \text{ is } \textit{Evil}(x) \\ q\theta \text{ is } \textit{Evil}(\textit{Joffrey}) \end{array}$ 

## Soundness of GMP

Need to show that

$$p_1', \ldots, p_n', \ (p_1 \wedge \ldots \wedge p_n \Rightarrow q) \models q\theta$$

provided that  $p_i'\theta = p_i\theta$  for all *i* Lemma: If  $\varphi$  is definite clause, then  $\varphi \models \varphi\theta$  by Universal Instantiation.

$$(p_1 \wedge \ldots \wedge p_n \Rightarrow q) \models (p_1 \wedge \ldots \wedge p_n \Rightarrow q) \theta = (p_1 \theta \wedge \ldots \wedge p_n \theta \Rightarrow q\theta)$$

**③** From 1 and 2,  $q\theta$  follows by ordinary Modus Ponens
