Abstract

A games model of a programming language with higher-order store in the style of ML-references is introduced. The category used for the model is obtained by relaxing certain behavioural conditions on a category of games previously used to provide fully abstract models of pure functional languages. The model is shown to be fully abstract by means of factorization arguments which reduce the question of definability for the language with higher-order store to that for its purely functional fragment.

Idioms for Interaction

— Invitation to Hacking in π -calculus —

Programming languages are tools which offer frameworks of abstraction for such activities – promoting or limiting them

- Imperative
- Functional
- Logical

- Programs : prescription of computational behaviours based on a certain abstraction.

On Programs and Programming

- The most fundamental element of a PL in this context is a set of operations it is based on:

Imperative: assignment, jump.

Functional: β -reduction.

Logical: unification.

- Another element is how we can combine, on structure, these operations:

Imperative: sequential composition, if-then-else, while, procedures, module,

Functional: application, product, union, recursion, modules,

UNSTRUCTURED:

```

data _stkl, 48 } stacks.
data _stkr, 48 }
data _i, 4 } index
data _j, 4 }
data _l, 4 } left/right limit
data _r, 4 }
data _x, 4 } pivot
data _w, 4 } temporary value.
data _s, 4 } stack pointer
data _a, 48 } table to be sorted.

mov $0, _s
mov $0, _stkl } 2nd instruction
mov $11, _stkr

L1: mov _s, rax } Top loop.
    mov _stkl(, rax, 4), rcx } l := stkl(s)
    mov rcx, _l
    mov _s, rax
    mov _stkr(, rax, 4), rcx } r := stkr(s)
    mov rcx, _r
    dec _s

L2: mov _l, rcx } j := l.
    mov rcx, _i
    mov _r, rcx } i := r.
    mov rcx, _j
    mov _l, rcx } rdx := l+r
    add _r, rcx
    mov rcx, rax } rdx := (l+r)/2
    mov rax, rdx
    shr $31, rdx
    add rdx, rax
    mov rax, rdx
    sar $1, rdx
    mov _a(, rdx, 4), rcx } x := a(rcx)
    mov rcx, _x

L3: mov _i, rax } third loop
    mov _a(, rax, 4), rdx } rdx := a(i)
    cmp rdx, _x
    jle L4
    inc _i
    jmp L3 } if rdx >= x goto (4)
    } else i := i+1
    } goto (3) (loop)

L4: mov _j, rax
    mov _a(, rax, 4), rdx } rdx := a(j)

```

STRUCTURED:

```

Var a: array[MAX] of int;

Procedure sort(l, r: int);
  Var i, j, x: int;
  i := l; j := r;
  x := [(l+r) div 2];
  • Choose a pivot.
  repeat
    while a[i] < x do i := i+1 end
    while a[j] > x do j := j-1 end
    if i <= j then swap(i, j); i := i+1; j := j-1; end
  until i > j;
  if l < j then sort(l, j);
  if l < i then sort(i, r);
  end
  } Partition into two parts.
  } Recursively sort two parts.

Procedure swap(i, j: int)
  Var w: int;
  w := a[i]; a[i] := a[j]; a[j] := w;
end

```

Quicksort in pure lambda:

$((\lambda xy. y(xy))(\lambda xy. y(xy)))\lambda q. \lambda l.$
 $((\lambda x. x(\lambda xy. x))l)(\lambda x. x)$ } if l is not then nil.
 $((\lambda xy. y(xy))(\lambda xy. y(xy)))(\lambda c. \lambda xy. x((\lambda x. x(\lambda py. x))x)y$ } concat.

 $((\lambda x. x(\lambda py. y))y))y((\lambda x. x(\lambda xyz. y))l))((\lambda x. x(\lambda xyz. z))l))))$ } cdr l

Quicksort with combinators:

$Y(\lambda f. \lambda l.$
 $(Isnil l)$
 $(Concat (f Filter (\lambda y. LT y (Car l))$
 $(Cdr l))$
 $(Cons (Car l)$
 $(f Filter (\lambda y. ME y$
 $(Car l)$
 $(Cdr l))))))$

$I = \lambda x. x$ $T = \lambda xy. x$ $F = \lambda xy. y$ $Y = (\lambda xy. y(xy))(\lambda xy. y(xy))$
 $Cons = \lambda xy. \lambda z. z F xy$ $Isnil = \lambda x. x T$
 $Car = \lambda x. x (\lambda yz. y)$ $Cdr = \lambda x. x (\lambda yz. z)$
 $Concat = Y (\lambda c. \lambda xy. x (Isnil x) y (Cons (Car x) (c (Cdr x) y))$
 $Filter = Y (\lambda f. \lambda px. (Isnil x) I (p (Car x)) (Cons x (Filter (Cdr x))))$
 $Iszero = \lambda x. x T$ $Pred = \lambda x. x F$ $(Filter (Cdr x))$
 $LT = Y (\lambda f. \lambda xy. (Iszero y) F ((Iszero x) F (f (Pred x) (Pred y)$
 $ME = Y (\lambda f. \lambda xy. (Iszero x) ((Iszero y) I F) ((Iszero y) (T) y))$
 $(f (Pred x) (Pred y))$

Quicksort in ML:

```
fun qs nil: int list = nil
```

```
| qs (x::r) = let val small =  
                filter (fn y => y < x) r  
                and large =  
                filter (fn y => y >= x) r
```

```
    in qs small @ [x] @ qs large
```

```
    end
```

```
fun filter p nil = nil
```

```
| filter p (x::r) =
```

```
    if p x then x := filter p r
```

```
    else filter p r
```

The Role of Types in π -Calculus.

- (classification) How can we classify name-passing interactive behaviours, i.e. behaviours representable in π -calculus? What classes ("types") of behaviours can we find in the calculus?

- (safety) Is this program/system in the safe (or correct, relevant,...) classes of behaviours? Can the safety be preserved compositionally?

Functional Types

with operation!

$$\left\{ \begin{array}{l} f : \alpha \rightarrow \beta \bullet e : \alpha = f \bullet e : \beta. \\ \text{else undefined.} \end{array} \right.$$

function application.

Process Types

- When it comes to processes, composition becomes:

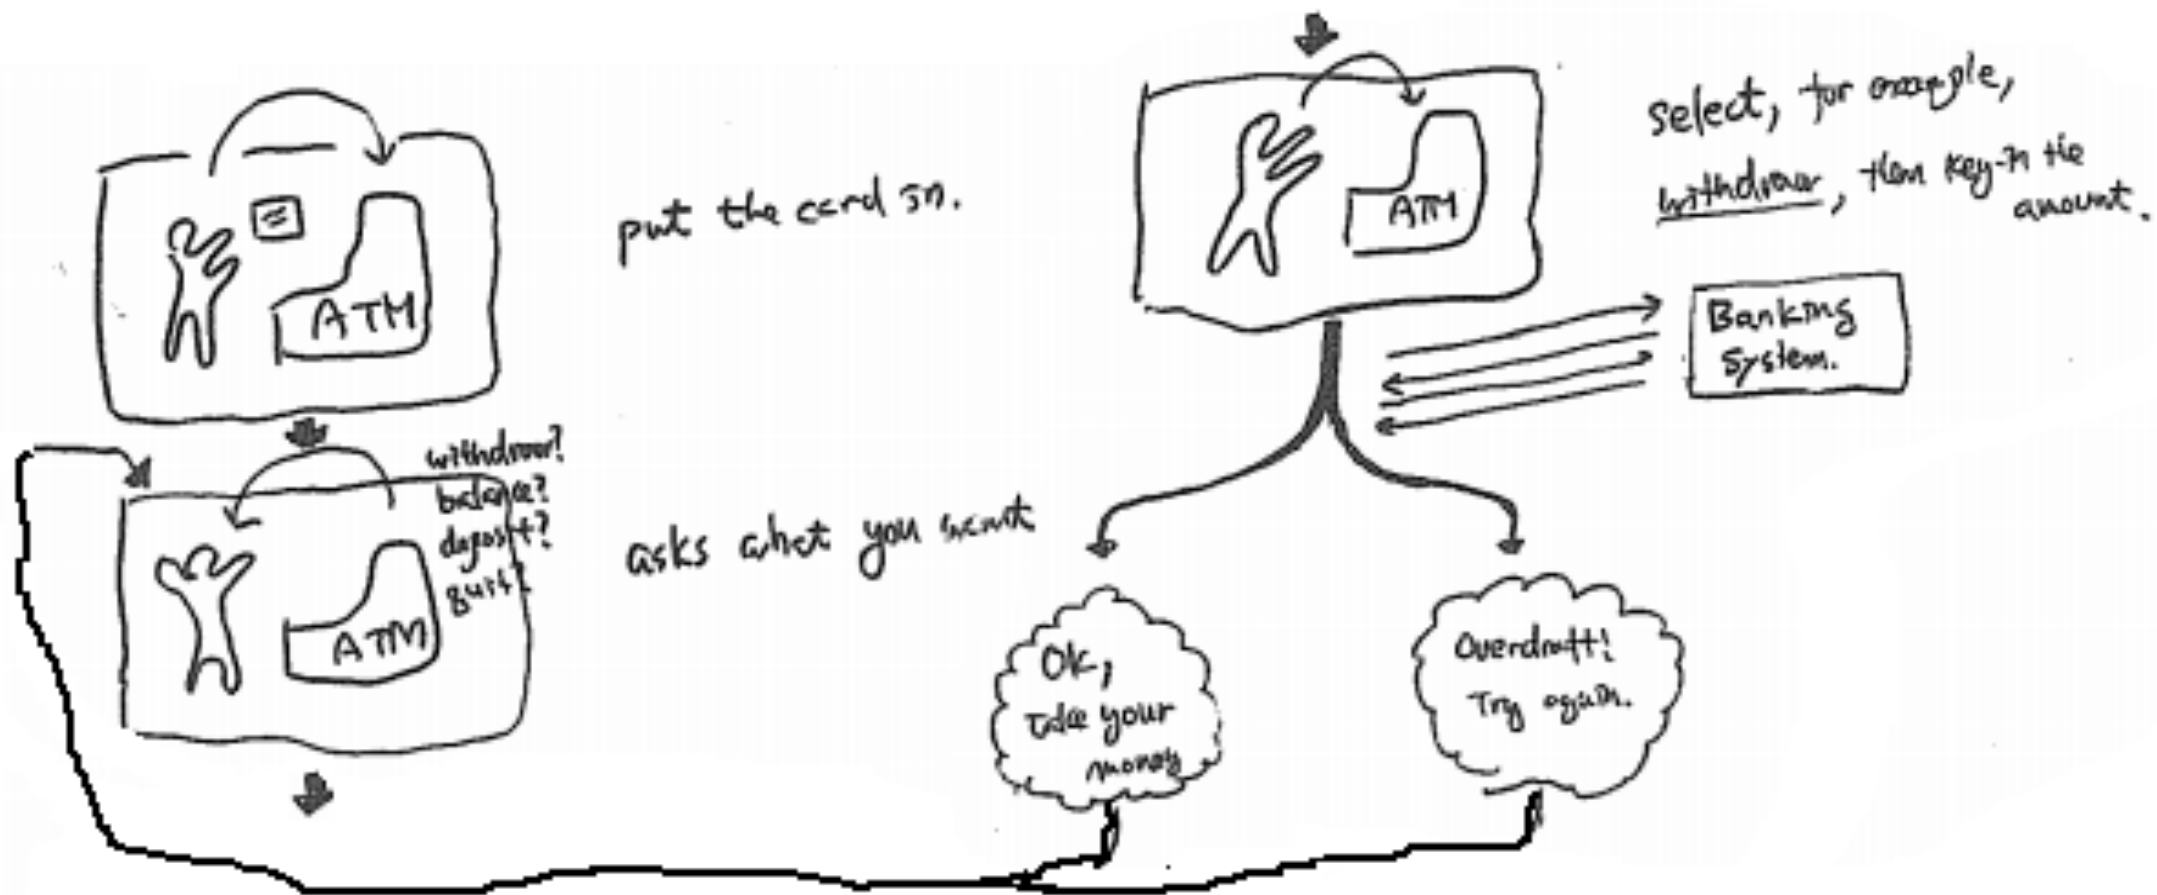

- But some composition is dangerous!

- Therefore we type processes,

Parametric Poly is Expressive Enough to Encode Inductive/Co-Inductive Types as Initial / Final (Co)Algebra

Coinductive Types

$$\begin{array}{ccc} X' & \xrightarrow{h} & T_f \\ f' \downarrow & & \downarrow f \\ F(X') & \xrightarrow{F(h)} & F(T_f) \end{array} \qquad \begin{array}{ccc} X' & \xrightarrow{\text{unfold } [X](f')} & \text{NatStream} \\ f' \downarrow & & \downarrow [\text{hd}, \text{tl}] \\ F(X') & \xrightarrow{F(\text{unfold } [X](f'))} & \text{Nat} \times \text{NatStream} \end{array}$$

Question Sess Poly π is Expressive Enough?

Theorems

$$\forall Q \text{ s.t. } u: F(X) \rightarrow X, y_1: T_z \vdash Q :: y_2: X. \text{Fold}(X) \cong Q$$

$$\forall_Q \text{ s.t. } u: A \rightarrow F(A), y_1: A \vdash Q :: y_2: T, Q \cong \text{Unfold}(A)$$

Application (2) $HO\pi + PROcess\ Monad$

- Full Abstraction / Inverse $x \langle M \rangle, P$
- Strong Normalisation via Strong Normalisation

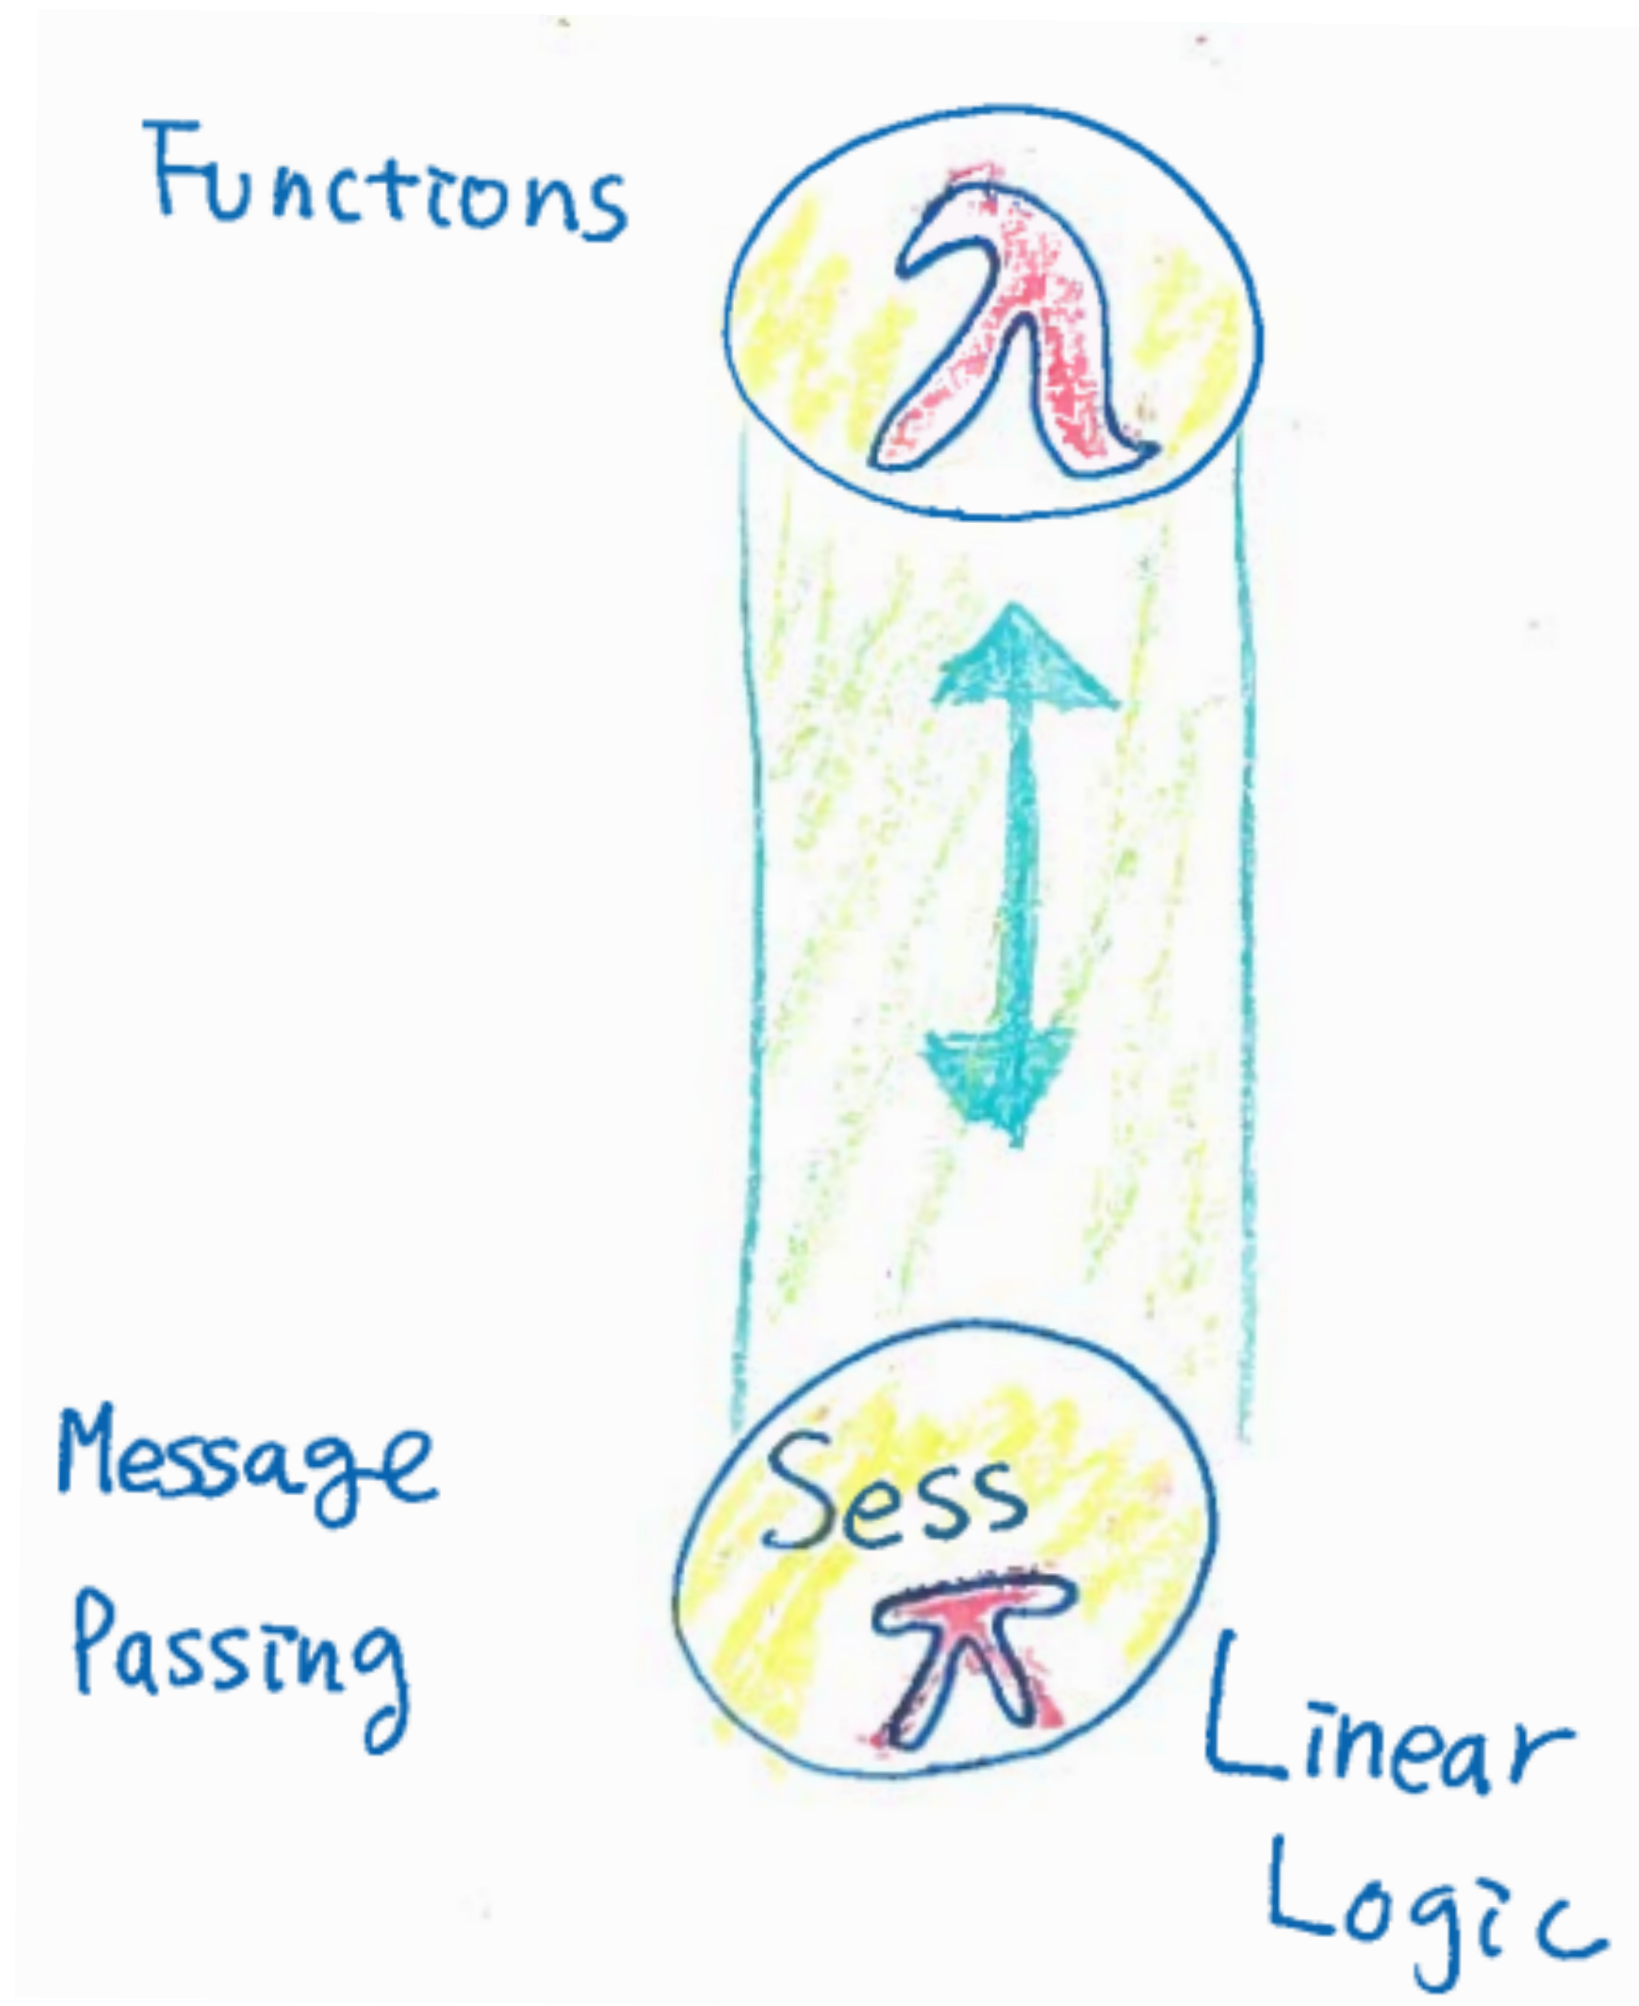

$HO\pi$

λ

$$P \rightarrow Q \quad \Rightarrow \quad (P) \dashv\dashv (Q)$$

cf. [CPPT'13] logical relation

Principles and Practice of Declarative Programming (PPDP23)

Termination

- A term is terminating if all its reduction sequences are finite.
- A central property in sequential programming models.

Termination

- A term is terminating if all its reduction sequences are finite.
- A central property in sequential programming models.
- Also important in concurrency, and for **message-passing programs**.
- We want: processes with **infinite** sequences of **observable** actions, intertwined with **finite** sequences of **internal** actions (reductions).

Termination

- A term is terminating if all its reduction sequences are finite.
- A central property in sequential programming models.
- Also important in concurrency, and for **message-passing programs**.
- We want: processes with **infinite** sequences of **observable** actions, intertwined with **finite** sequences of **internal** actions (reductions).

Our work

- Termination of π -calculus processes.
Infinite behaviors arise from server processes (replicated inputs).

$$!x(y).x\langle y\rangle.0 \mid x\langle w\rangle.0 \longrightarrow !x(y).x\langle y\rangle.0 \mid x\langle w\rangle.0 \mid 0 \longrightarrow \dots$$

- Several different **type systems**: how do they relate to each other?
- We **formally compare** two representative type systems.
Approach: Contrast the classes of (session) processes they can type.

Approach and Results

The Class \mathcal{S}

- Session typed π -calculus by Vasconcelos
- Very flexible and expressive
- Good baseline for comparisons

Approach and Results

The Class \mathcal{S}

- Session typed π -calculus by Vasconcelos
- Very flexible and expressive
- Good baseline for comparisons

The Class \mathcal{L}

- Follows ‘propositions-as-sessions’
by Caires & Pfenning
- Termination via Curry-Howard

Approach and Results

The Class \mathcal{S}

- Session typed π -calculus by Vasconcelos
- Very flexible and expressive
- Good baseline for comparisons

The Class \mathcal{L}

- Follows ‘propositions-as-sessions’ by Caires & Pfenning
- Termination via Curry-Howard

The Class \mathcal{W}

- Follows weight-based type systems by Deng & Sangiorgi
- Proof by well-founded measures

Approach and Results

The Class \mathcal{S}

- Session typed π -calculus by Vasconcelos
- Very flexible and expressive
- Good baseline for comparisons

The Class \mathcal{L}

- Follows ‘propositions-as-sessions’ by Caires & Pfenning
- Termination via Curry-Howard

The Class \mathcal{W}

- Follows weight-based type systems by Deng & Sangiorgi
- Proof by well-founded measures

- Three process models ($\pi_{\mathcal{S}}$, $\pi_{\mathcal{W}}$, π_{DILL}) with different syntax/types.
- Classes \mathcal{W} and \mathcal{L} defined using **typed encodings**.
We have $\mathcal{W} \subset \mathcal{S}$ and $\mathcal{L} \subset \mathcal{S}$.
- Main results: $\mathcal{L} \subset \mathcal{W}$ and $\mathcal{W} \not\subset \mathcal{L}$.

Main Results

$\mathcal{L} \subset \mathcal{W}$

- Every (terminating) process in the logic-based approach is typable using the weight-based approach.
- Key idea: For every $P \in \mathcal{L}$, extract a **weight function** to enable typability for P in the weight-based system (up to a typed encoding).

$\mathcal{W} \not\subset \mathcal{L}$

- By counter-example: there are terminating processes typable using weights, but not typable in the Curry-Howard correspondence.
- The weight-based approach captures **more server behaviors** than those induced by linear logic (copying semantics for $!A$).

Approach and Results

The Class \mathcal{S}

- Session typed π -calculus by Vasconcelos
- Very flexible and expressive
- Good baseline for comparisons

The Class \mathcal{L}

- Follows ‘propositions-as-sessions’ by Caires & Pfenning
- Termination via Curry-Howard

The Class \mathcal{W}

- Follows weight-based type systems by Deng & Sangiorgi
- Proof by well-founded measures
