We don't want to represent all this detail with geometry

Some slides adopted from H. Pfister, Harvard

## The Solution: Textures

## The Quest for Visual Realism

- The visual appearance of a graphics scene can be greatly enhanced by the use of texture
- Consider a brick building, using a polygon for every brick require a huge effort in scene design.
- So why not use one polygon and draw a repeating brick pattern (texture) onto it?

## Texture Definition

## Procedural textures

- Write a function: $F(\mathbf{p}) \rightarrow$ color
- Pixmaps - Arrays containing the actual pixel values to be mapped to the polygon, e.g. photos.
- Procedures - Suitable for repeating patterns.

- non-intuitive
- difficult to match existing texture

## Photo textures

## The concept of texture mapping

Texture mapping: Terminology

## Texture Coordinates

- Specify a texture coordinate $(s, t)$ at each vertex
- Canonical texture coordinates $(0,0) \rightarrow(1,1)$
- Often the texture size is a power of 2
(but it doesn't have to be)
- How can we tile this texture?

The concept of texture mapping

## Tiling Texture

tiles with
visible seams

Texture synthesis

## Texture coordinates

- Specify a texture coordinate $(s, t)$ at each vertex
- Canonical texture coordinates $(0,0) \rightarrow(1,1)$
- Linearly interpolate the values in screen space

## What Goes Wrong?

- Interpolate texture coordinates across scanlines
- Same as Gouraud shading but now for texture coordinates not shading values

- Notice the distortion along the diagonal triangle edge of the cube face

## Perspective projection

- The problem is that perspective projection does not preserve affine combinations of points!
- In particular, equal distances along a line in eye space do not map to equal distances in screen space

- Linear interpolation in screen space is not equal to linear interpolation in eye space!

## How to fix?

- We cannot linearly interpolate $t$ between $\mathbf{p}$ ' and $\mathbf{r}$,
- Only projected values can be linearly interpolated in screen space
- Solution: perspective-correct interpolation

## How to fix?

- Suppose we assign parameter $t$ to vertices $\mathbf{p}$ and $\mathbf{r}$
- Suppose $t=0$ at $\mathbf{p}$, and $t=1$ at $\mathbf{r}$
- p projects to $\mathbf{p}$ ' and $\mathbf{r}$ projects to $\mathbf{r}$ ' (divide by $w$ )
- What value should $t$ have at location $\mathbf{q}$ '?

## Perspective Correct Interpolation

- Linearly interpolate $t / w($ not $t)$ between $\mathbf{p}$ ' and $\mathbf{r}$ '.
- Compute $t_{\mathrm{p}^{\prime}}=t_{\mathrm{p}} / w_{\mathrm{p}}$ and $t_{\mathrm{r}^{\prime}}=t_{\mathrm{r}} / w_{\mathrm{r}}$
- Linearly interpolate (lerp) $t_{\mathrm{p}}$, and $t_{\mathrm{r}}$, to get $t_{\mathrm{q}^{\prime}}$ at location $\mathbf{q}^{\prime}$
- But, we want the (unprojected) parameter $t_{\mathrm{q}}$, not $t_{\mathrm{q}}$,

## Perspective Correct Interpolation

- The parameter $t_{\mathrm{q}}$ is related to $t_{\mathrm{q}}$ by a factor of $1 / w$ :
- Lerp $1 / w_{\mathrm{p}}$ and $1 / w_{\mathrm{r}}$ to obtain $1 / w_{\mathrm{q}}$ at point $\mathbf{q}$.
- Divide $t_{\mathrm{q}}$, by $1 / w_{\mathrm{q}}$ to get $t_{\mathrm{q}}$

## Perspective Correct Interpolation

- Summary:
- Given parameter $t$ at vertices:
- Compute 1 / $w$ for each vertex
- Linearly interpolate $1 / w$ across the triangle
- Linearly interpolate $\mathrm{t} / \mathrm{w}$ across the triangle
- Do perspective division:

Divide $t / w$ by $1 / w$ to obtain interpolated parameter $t$

Mapping texture to individual pixels

## Non Linearities in texture mapping

- The second order term means that straight lines in the texture may become curved when the texture is mapped.
- However, if the mapping is to a parallelogram: $\mathbf{p}=\alpha \mathbf{a}+\beta \mathbf{b}+\alpha \beta(\mathbf{c}-\mathbf{b})$
and
$\mathrm{b}=\mathrm{c}$
so $\mathbf{p}=\alpha \mathbf{a}+\beta \mathbf{b}$

## Texture Mapping \& Illumination

- Texture mapping can be used to alter some or all of

## 2D Texture Mapping

- Increases the apparent complexity of simple geometry the constants in the illumination equation

$$
L\left(\omega_{r}\right)=k_{a}+\left(k_{d}(\mathbf{n} \cdot \mathbf{l})+k_{s}(\mathbf{v} \cdot \mathbf{r})^{q}\right) \frac{\Phi_{s}}{4 \pi d^{2}}
$$

- Can specify variations in shading within a primitive:
- Illumination
- Surface Reflectance

## What's Missing?

- What's the difference between a real brick wall and a photograph of the
wall texture-mapped onto a plane?
- What happens
if we change the lighting or the camera position?

Remember Normal Averaging for Shading?

- Instead of using the normal of the triangle, interpolate an averaged

## Bump Mapping

- Textures can be used to alter the surface normal of an object.

## Bump Mapping

- The texture map is treated as a single-valued height function.
- The partial derivatives of the texture tell us how to alter the true surface normal at each point to make the object appear as if it were deformed by the height function.

## What's Missing?

- What does a texture- \& bumpmapped brick wall look like as you move the viewpoint?
- What does the silhouette of a bump-mapped sphere look like?

## Displacement Mapping

- Use the texture map to actually move the surface point - How is this different than bump mapping?
- The geometry must be displaced before visibility is determined.

## Environment Maps

- We can simulate reflections by using the direction of the reflected ray to index a spherical texture map at "infinity".
- Assumes that all reflected rays begin from the same point.

## Environment Mapping Example
