Figure 1: Graph $G_{1}$

Figure 2: Graph $G_{2}$

1. The graph $G_{1}$ represents a set of connected web pages. Taking $c=4 / 5$, write down:
(a) The transition matrix $P$
(b) The personalisation vector $\vec{p}$
(c) The modified transition matrix $A$
(d) Two iterations of $\vec{x}_{(k+1)}=\vec{x}_{(k)} A$, i.e. $\vec{x}_{(1)}, \vec{x}_{(2)}$ with $\vec{x}_{(0)}=(0,1,0)$
(e) Two iterations of the PageRank algorithm for comparison
(f) The value $\delta=\left\|\left|\vec{x}_{(k+1)}-\vec{x}_{(k)}\right|\right\|_{1}$ for each iteration

If you have access to a machine you can implement the PageRank algorithm on slide 17 using an $\epsilon$-value of 0.01 , instead of doing parts (d) and (e) by hand. How many iterations does it take to converge?
2. Repeat question 1 for the graph $G_{2}$, this time with $\vec{x}_{(0)}=(1,0,0,0)$. How does the answer/convergence vary if you alter $c$ ?
3. Suggest scalable techniques for implementing each of the vector operations below across several processors, where as necessary each processor has the same partitioned set of rows for each vector $\vec{v}_{1}$ and $\vec{v}_{2}$
(a) $v_{1}+v_{2}$
(b) $\left\|v_{1}\right\|_{1}$
(c) $\alpha v_{1}$ for some scalar multiplier, $\alpha$
